31. Exam Answer Evaluator

A faculty member pre-screens short answers.

Task: Using the OpenAI API, score 2-mark answers against a model answer (0/1/2) with a one-line justification. Demonstrate on five answers, including one correct answer worded very differently from the key.

Title: Exam Answer Evaluator

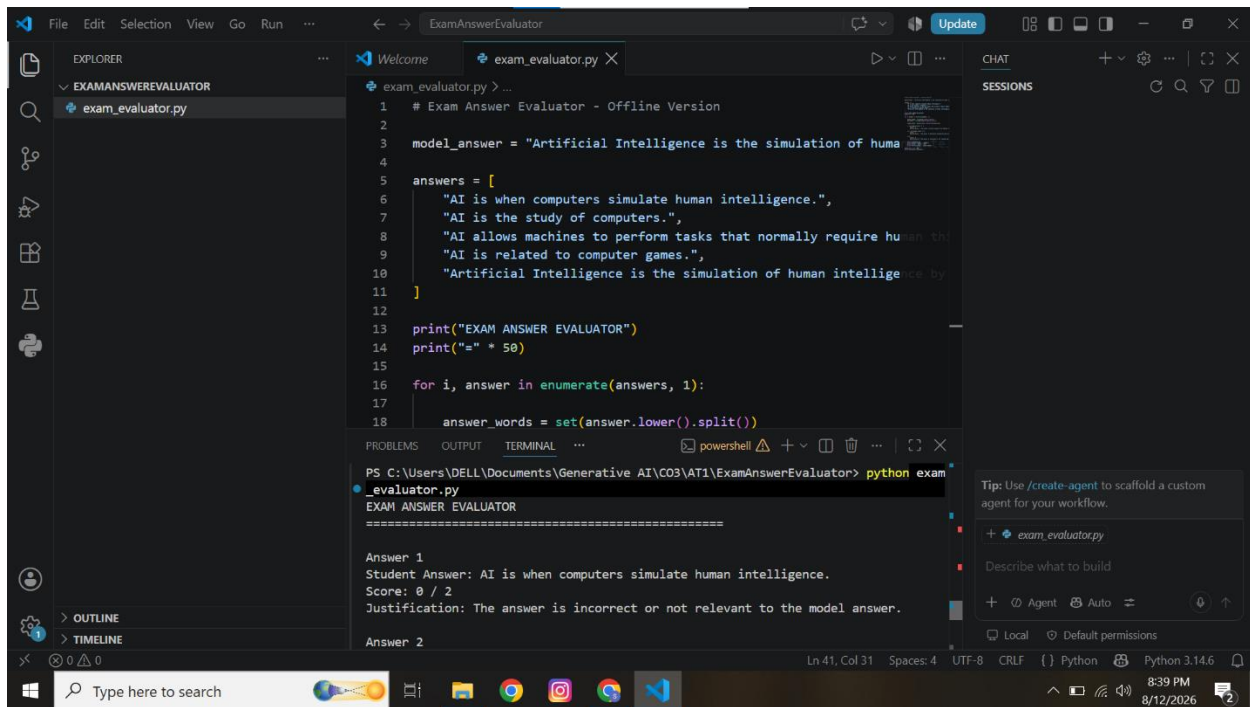

Input:

- Model answer
- 5 student answers

Processing:

- Compare student answers with the model answer
- Assign 0, 1, or 2

Code and Output:

```
1 # Exam Answer Evaluator - Offline Version
2
3 model_answer = "Artificial Intelligence is the simulation of human intelligence."
4
5 answers = [
6     "AI is when computers simulate human intelligence.",
7     "AI is the study of computers.",
8     "AI allows machines to perform tasks that normally require human intelligence.",
9     "AI is related to computer games.",
10    "Artificial Intelligence is the simulation of human intelligence by machines."
11 ]
12
13 print("EXAM ANSWER EVALUATOR")
14 print("=" * 50)
15
16 for i, answer in enumerate(answers, 1):
17
18     answer_words = set(answer.lower().split())
```

EXAM ANSWER EVALUATOR

=====

Answer 1
Student Answer: AI is when computers simulate human intelligence.
Score: 0 / 2
Justification: The answer is incorrect or not relevant to the model answer.

Answer 2

Conclusion:

The system evaluates short answers and provides a score with a brief justification.
